小米弹性调度平台 从PaaS到DCOS

孙寅

小米资深架构师,负责小米运维体系基础架构,基础平台

平台演进

SCOPE

capability

Maximize the

Utilization of

Resource

Auto

Scaling

Dependency Chain

Auto

PipeLine

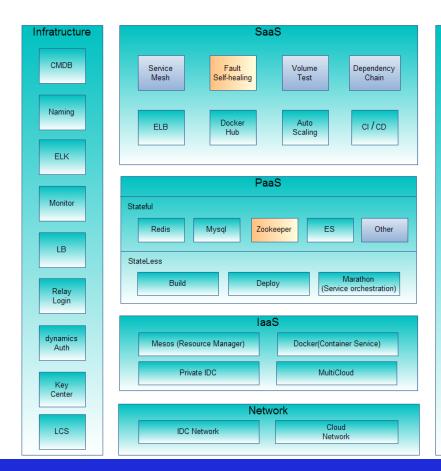

Auto Volume Test

Service

Mesh

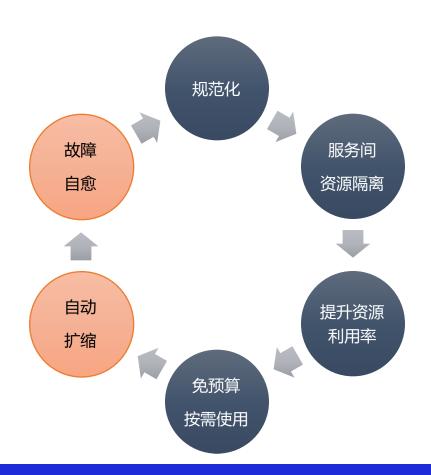

Fault

Self-healing

平台收益

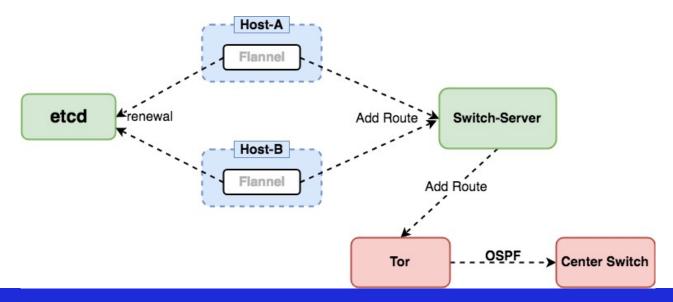

PaaS平台

容器网络

- ▶方案演进: MACVLAN (DHCP) -> Flannel (HostGW)
- ▶DEMO过: MACVLAN(自定义CNI插件)、Calico、Culim
- ▶网络性能、架构可靠性的最佳折中

Docker-Init

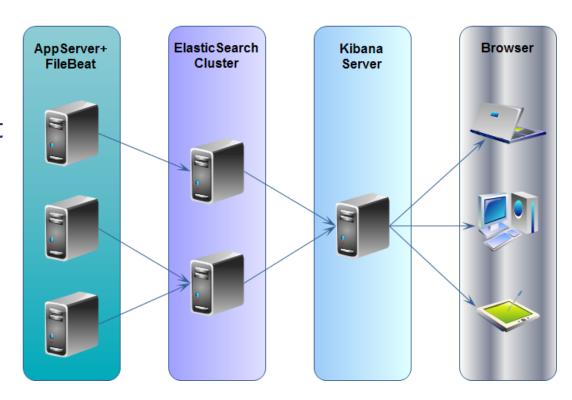

- ▶进程组
- ▶健康检查端口
- ▶容器启动退出钩子
- ▶回收僵尸进程
- ▶调试模式
- ▶注入环境变量开关
- ▶与内部基础设施对接

日志服务

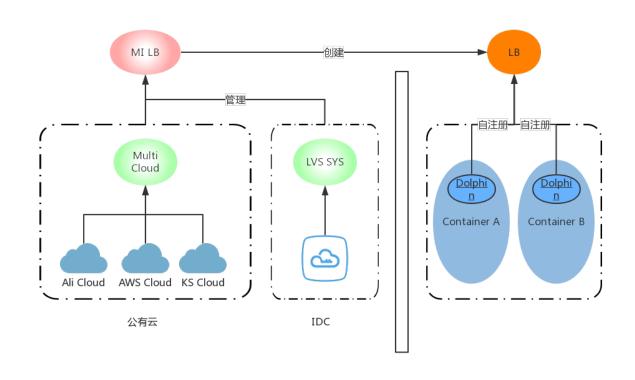

- ▶ 更轻量的客户端FileBeat
- > 容器退出后延迟回收
- ▶ 日志目录规范+自发现
- > 行检索的挑战

负载均衡(ELB)

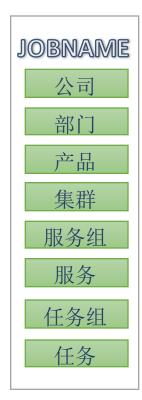

- ▶自动配置域名,按运营商自动划分线路
- ➤docker-init和ELB服 务都会动态更新LVS 配置,可重入
- ➤云厂商集群,多一层 HAProxy

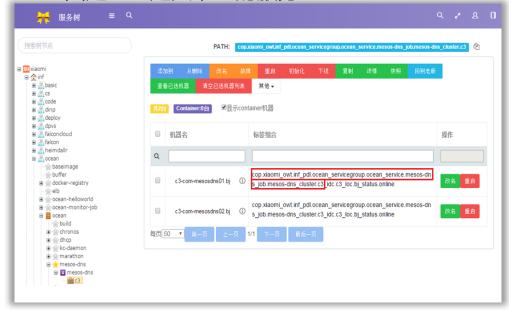

服务树

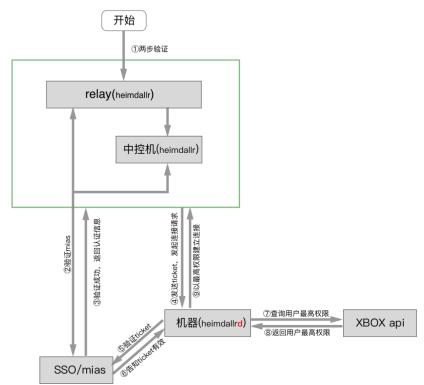

- ▶为服务器打TAG
- ▶8固定TAG定义唯一的服务

免密安全登录

- ▶基于服务树节点授权
- ▶每登录认证凭据

监控-全Push采集

DOIS

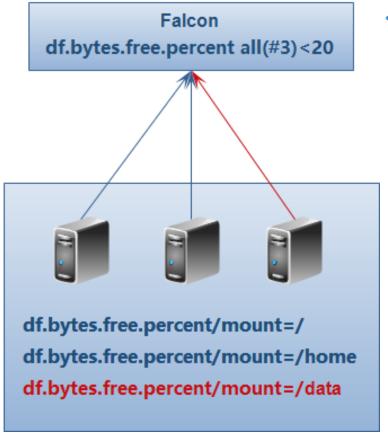

- ▶与动态环境更亲和
- ▶促成自动发现能力

监控-策略自发现

- ▶ 节点内增加主机或容器
- ▶ 主机或容器增加分区

自动扩缩

▶Falcon自动采集

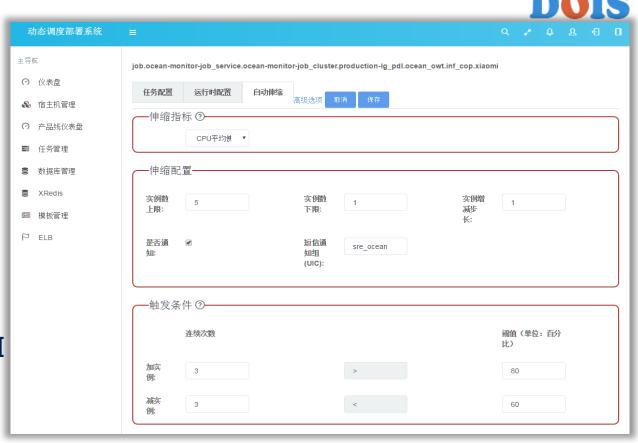

CPU IDLE

MEM FREE

PROC QPS

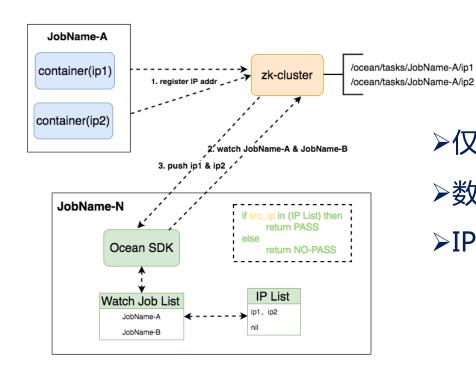

PROC DELAY

- ➤ Hook回调 Marathon/K8S API
- ▶ 最短5s触发伸缩

动态安全

- ➤ 仅需Server端嵌入SDK和配置
- ▶数据库, DB-Proxy简化接入
- ▶IP+JOBNAME共同生效,防御ZK故障

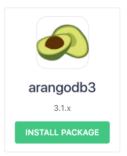

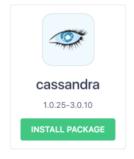

向DCOS进化

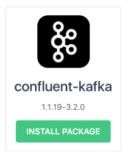

服务化组件

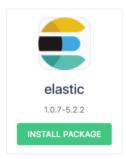

Selected Packages

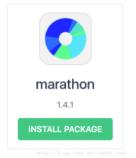

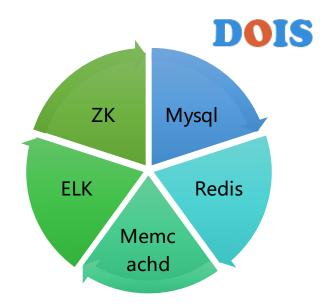

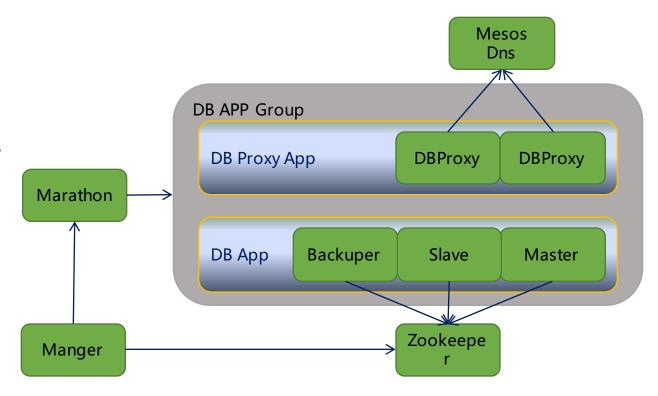

- ▶ 规范配置
- > 数据自动迁移
- > 故障自愈

RDS

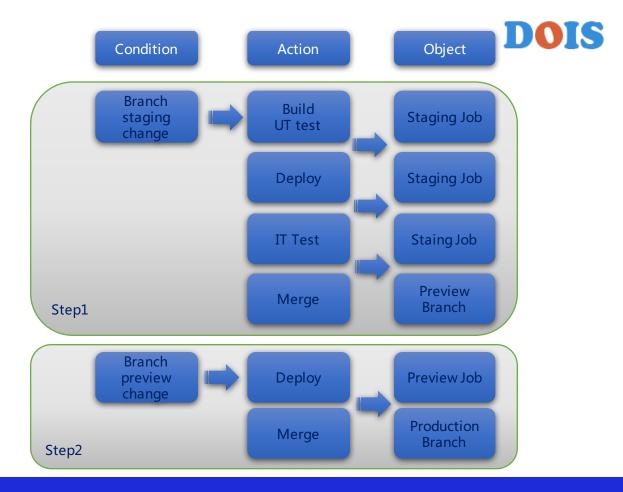

- ▶备库同步复制,用
 于故障实例恢复数据
- ▶从库故障自动恢复数据,主库故障自动切换

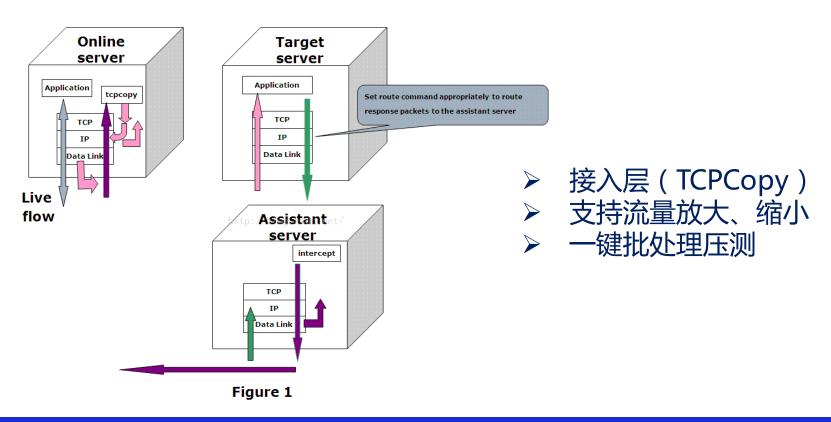

PIPELINE

流量镜像、一键压测

混沌军团

- 随机关闭生产环境中的实例, 模拟服务故障
- 引入人为延时,模拟服务降级
- 寻找未使用、可被清理的资源
- 寻找不符合预定义最佳实践的 服务
- 发现和跟踪异常修改,排查安全问题

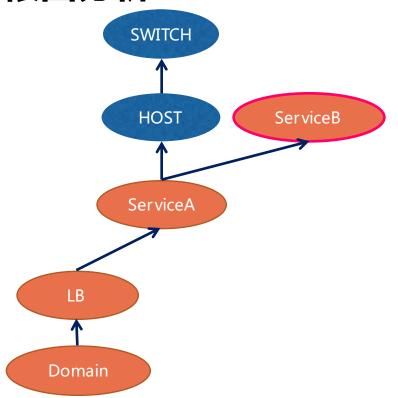

未来DCBrain

根因分析

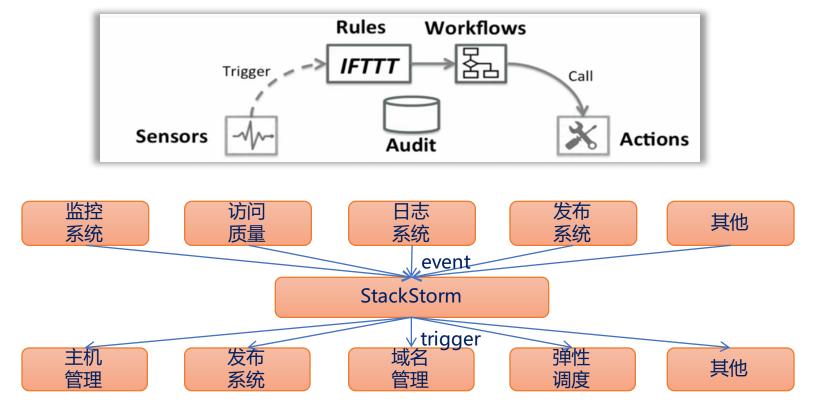

- 自动发现依赖拓扑
- > 完善的监控点
- 决策树找到最末报警点

故障自愈
